Indicates genomic contigs or singletons from which the ATUs are identified and the location of the ATU within the contig or singleton. In cases where the first numeral is higher than its corresponding second numeral, the *Arabidopsis thaliana* protein or fragment thereof is encoded by the complement of the sequence set forth in the sequence listing. The first numeral separated from the contig or singleton ID by a colon represents the starting point for the codon for the most N-terminal (if the first number is lower than the second number) or C-terminal (if the first number is higher than the second number) amino acid for the protein or protein fragment encoded by the ATU.
